siunitx

On change les règles liés aux opérations pour intégrer dans ces règles l'associativité à gauche et la priorité des multiplication et division.

On change les règles :

Par:

$$< expr > \rightarrow T + < expr > \\ \rightarrow T - < expr > \\ \rightarrow T$$

$$\begin{array}{ccc} T & & \rightarrow I * T \\ & \rightarrow I / T \\ & \rightarrow I \end{array}$$

$$\begin{split} \mathbf{I} & \rightarrow \mathbf{F} = \mathbf{I} \\ \rightarrow \mathbf{F} / = \mathbf{I} \\ \rightarrow F < I \\ \rightarrow F < = I \\ \rightarrow F > I \\ \rightarrow F > = I \\ \rightarrow \mathbf{F} \text{ rem I} \\ \rightarrow \mathbf{I} \end{split}$$

$$\begin{array}{ccc} F & & \rightarrow P \\ & \rightarrow -P \\ & \rightarrow \ not \ \ P \end{array}$$

P
$$\rightarrow$$
 < entier >
 \rightarrow < caractere >
 \rightarrow true
 \rightarrow false
 \rightarrow null
 \rightarrow < acces >
 \rightarrow new < ident >
 \rightarrow < ident > (< expr >, +)
 \rightarrow character ' val (< expr >)
 \rightarrow (< expr >)

En factorisant, on obtient.

$$< expr > \rightarrow T < expr >_{1}$$
 $< expr >_{1} \rightarrow + < expr >_{2} \rightarrow - < expr >_{2} \rightarrow \wedge$

T $\rightarrow I T_{1}$
 $T_{1} \rightarrow * T$
 \Rightarrow / T
 $\Rightarrow /$

 $\rightarrow (<expr>)$

On injecte les règles de < acces > dans les règles ci-dessous pour supprimer la règle < acces > et ainsi résoudre des conflits :

$$\begin{split} \mathbf{P} & \rightarrow < acces > \\ < instr > \rightarrow < acces > := < expr >; \end{split}$$

On obtient les règles :

$$\begin{split} \rightarrow := ; \\ \rightarrow . := ; \end{split}$$

$$\begin{array}{ll} P & \longrightarrow < ident> \\ & \rightarrow < expr> \ . \ < ident> \end{array}$$

La règle $P \to \langle expr \rangle$. $\langle ident \rangle$ offre la possibilité de finir une expression par . $\langle ident \rangle$. Or, une expression se termine toujours par l'une des parties droites des règles $P \to$ et ces parties droites terminent toujours une expression.

Donc, on peut remplacer :
$$P \rightarrow \langle expr \rangle$$
 . $\langle ident \rangle$

Par:

$$\begin{split} \mathbf{P} &\rightarrow \langle \mathbf{entier} \rangle \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \langle \mathbf{caractere} \rangle \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \mathit{true} \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \mathit{false} \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \mathit{null} \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \langle \mathbf{ident} \rangle \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \langle \mathbf{ident} \rangle \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \langle \mathbf{ident} \rangle \; (\langle \mathbf{expr} \rangle_+^+) \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow \mathit{character}' \; \mathit{val} \; (\langle \mathbf{expr} \rangle) \; . \; \langle \mathbf{ident} \rangle \\ &\rightarrow (\langle \mathbf{expr} \rangle) \; . \; \langle \mathbf{ident} \rangle \end{split}$$

On développe la grammaire pour ensuite appliquer la dérécursivation :

```
\langle fichier \rangle \rightarrow \text{with Ada.Text IO}; use Ada.Text IO; procedure \langle ident \rangle is begin \langle instr \rangle^+ end; EOF
               \rightarrow with Ada. Text IO; use Ada. Text IO; procedure < ident > is < decl > begin < instr > end; EOF

On injecte les règles de $\langle expr \rangle$ dans la règle :

$$\langle instr \rangle \rightarrow \langle expr \rangle$$
. $\langle ident \rangle := \langle expr \rangle$;

On obtient:

$$\langle instr \rangle \rightarrow T \langle expr \rangle_1 . \langle ident \rangle := \langle expr \rangle;$$

On injecte les règles de T dans la règle :

$$\langle instr \rangle \rightarrow T \langle expr \rangle_1 . \langle ident \rangle := \langle expr \rangle;$$

On obtient:

$$\langle instr \rangle \rightarrow I T_1 \langle expr \rangle_1 . \langle ident \rangle := \langle expr \rangle;$$

On injecte les règles de I dans la règle :

$$\langle instr \rangle \rightarrow I T_1 \langle expr \rangle_1 . \langle ident \rangle := \langle expr \rangle;$$

On obtient :

$$\langle instr \rangle \rightarrow FI_1 T_1 \langle expr \rangle_1 . \langle ident \rangle := \langle expr \rangle;$$

On injecte les règles de F dans la règle :

$$< instr > \rightarrow FI_1 T_1 < expr >_1 . < ident > := < expr >;$$

On obtient :

$$< instr > \rightarrow P \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >;$$

 $\rightarrow -P \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >;$
 $\rightarrow not \ P \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >;$

On injecte les règles de P dans la règle :

$$\langle instr \rangle \rightarrow P I_1 T_1 \langle expr \rangle_1 . \langle ident \rangle := \langle expr \rangle;$$

On obtient:

```
 < instr > \to < entier > P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < caractere > P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to true \ P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to false \ P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to null \ P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to new < ident > P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to character'val(< expr >)P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to (< expr >)P_1 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >; \\ \to < ident > P_2 \ I_1 \ T_1 < expr >_1 \ . < ident > := < expr >_2 \ . \\ \to < ident > := < expr >_2 \ . \\ \to < ident > := < expr >_2 \ . \\ \to < ident > := < expr >_2 \ . \\ \to < ident > := < expr >_2 \ . \\ \to < ident > := < expr >_2 \ . \\ \to < ident > := < expr >_2 \ . \\ \to < ident > := < expr >_2 \ . \\ \to < ident > := < expr
```

On injecte les règles de P_2 dans la règle :

$$\langle instr \rangle \rightarrow \langle ident \rangle P_2 I_1 T_1 \langle expr \rangle_1 . \langle ident \rangle := \langle expr \rangle;$$

On obtient:

$$< instr > \rightarrow < ident > . < ident > I_1 T_1 < expr >_1 . < ident > := < expr >;$$

 $\rightarrow < ident > (< expr >^+_,) I_1 T_1 < expr >_1 . < ident > := < expr >;$
 $\rightarrow < ident > I_1 T_1 < expr >_1 . < ident > := < expr >;$

On injecte les règles de $\langle instr \rangle_1$ dans la règle :

$$\langle instr \rangle \rightarrow \langle ident \rangle \langle instr \rangle_1$$

On obtient:

$$< instr > \rightarrow < ident > := < expr > ;$$

 $\rightarrow < ident > ;$
 $\rightarrow < ident > (< expr > +);$

On a au final:
